Set Up Two GitHub Accounts on Windows

Use separate SSH keys so you can push to repositories with the correct GitHub account. This guide uses PowerShell.

Why the 403 error happened

GitHub authenticated your push as **gautamankul**, but that account does not currently have permission to push to **dhanushankul/transpostbuddy**. Using another key selects another account; that account must still have repository write access.

1. Check your current configuration

```
git config --global user.name
git config --global user.email
git remote -v
```

The Git name and email identify commits; they do not grant repository permissions.

2. Create a separate SSH key for each account

```
ssh-keygen -t ed25519 -C "first-email@example.com" -f "$HOME\.ssh\id_ed25519_personal"
ssh-keygen -t ed25519 -C "second-email@example.com" -f "$HOME\.ssh\id_ed25519_second"
```

Use the email associated with each account. A passphrase is recommended. If these key files already exist, do not overwrite them; choose another filename or reuse the existing key.

3. Add the public keys to GitHub

```
Get-Content "$HOME\.ssh\id_ed25519_personal.pub"
Get-Content "$HOME\.ssh\id_ed25519_second.pub"
```

For each account, open https://github.com/settings/keys, select **New SSH key**, and paste the matching public key. Never share the private key files (the files without .pub).

4. Configure SSH aliases

Open the SSH config file:

```
notepad "$HOME\.ssh\config"
```

Add the following, then save the file:

```
# First GitHub account
Host github-personal
    HostName github.com
    User git
    IdentityFile ~/.ssh/id_ed25519_personal
    IdentitiesOnly yes

# Second GitHub account
Host github-second
    HostName github.com
    User git
    IdentityFile ~/.ssh/id_ed25519_second
    IdentitiesOnly yes
```

5. Test both account connections

```
ssh -T git@github-personal
ssh -T git@github-second
```

Each command should identify the expected GitHub username. GitHub may say that shell access is not provided; that is normal.

6. Push transpostbuddy using the second account

Run these commands from E:\transportbuddy (or your actual project folder):

```
git remote set-url origin git@github-second:dhanushankul/transpostbuddy.git
git remote -v
git push -u origin master
```

*If your branch is named main, use **main** instead of **master**. The second account must have write access to this repository, or the owner must grant it.*

7. Set the commit identity for this repository

```
git config user.name "Your Second GitHub Name"
git config user.email "second-email@example.com"
```

These settings apply only to the current repository. Use the matching identity and remote in each other repository.

Optional: push the same project to two repositories

If you want the same local branch pushed to both GitHub repositories, keep two remotes:

```
git remote rename origin second
git remote add personal git@github-personal:YOUR_USERNAME/YOUR_REPO.git

git push -u second master
git push -u personal master
```

Replace YOUR_USERNAME/YOUR_REPO with your actual repository. Both repositories must exist and the matching account must have write access.
